

Cognitive Orchestrator

1. What it is

Cognitive Orchestrator is a **governed decision gateway** for enterprise workflows—starting with **vendor onboarding**. It sits in front of high-stakes approvals and produces a **hash-chained evidence pack** for every decision: inputs, policy outcome, optional reasoning summary, human override, and committed spend. Risk and finance get an exportable audit trail; procurement gets a consistent, policy-first path.

The system also includes a structured reasoning pipeline (multi-mode intuition generation, deterministic pruning, constrained dialectic, and optional insight injection) that can support borderline cases. The commercial product is the **gate and the evidence pack**, not a general-purpose chatbot.

2. Core capabilities

- **Policy gate** — auto-approve under threshold, escalate above threshold, reject restricted data classes, enforce monthly budget.
- **Evidence packs** — SHA-256 chained records per decision; full ledger export for audit.
- **Reasoning layer** — optional structured synthesis for cases that need human review.
- **Deployment** — self-hosted or dedicated instance; API-key auth and rate limiting.
- **Providers** — OpenAI and Groq via configuration; in-memory or Redis session buffer.

3. Technical status (as of Oct 2026)

Item	Status
Version	0.4.0 (open source core + gateway)
Automated tests	62 unit/API tests passing
Local pipeline overhead	Median ~0.11 ms (mocked LLM; excludes provider network)
Primary workflow	Vendor onboarding decisions
Repository	github.com/Mourad-Soltani/cognitive-orchestrator

4. Design-partner pilot offer

Fee: USD \$50,000 · Term: 60 days · Scope: vendor onboarding only.

- Dedicated or self-hosted instance; policy thresholds tuned to your spend and data classes.
- Evidence packs for every decision; weekly review with risk/finance.
- Success: ≥25 live decisions; risk/finance confirms pack is usable; no critical security blocker.
- If success is met: 100% of pilot fee credited to year-1 platform (\$250,000–\$500,000).

This is a paid pilot with a conversion path—not an unpaid experiment or unlimited API trial.

5. Why a pilot company would care

Vendor approvals often leave an incomplete trail (email, Slack, spreadsheets). When audit or risk asks why a supplier was approved, reconstruction is slow and inconsistent. A policy-first gate with a hash-chained pack is designed to make that answer routine—without replacing your existing security questionnaire process on day one.

Valuation context for pilot partners

Indicative ranges for discussion · Not a formal appraisal or offer to sell equity

6. How to read valuation here

The figures below describe **indicative commercial value of the software and pilot package**, not a priced equity round and not a guarantee of future company value. They are grounded in: (a) comparable tooling for policy/audit around AI and procurement decisions, (b) the paid pilot and platform fee structure, and (c) the current stage—working product, test suite, no booked ARR from this gateway yet.

7. Indicative value ranges

Scenario	Indicative range	What it assumes
Code / non-exclusive license	\$25,000 – \$70,000	Reference implementation + docs; limited support
Exclusive IP + limited support	\$120,000 – \$300,000	Transfer of core IP; short transition support
Strategic acquisition (early)	\$400,000 – \$900,000	Motivated buyer; product fit; founder continuity optional
Design-partner pilot (this offer)	\$50,000 / 60 days	Scoped vendor-onboarding pilot; success-based platform path
Year-1 platform (post-pilot)	\$250,000 – \$500,000	Production use; pilot fee fully credited if success met

Higher “billion-dollar company” outcomes require scaled ARR, distribution, and team—they are not implied by the current codebase alone. Asking prices in older marketing materials above the exclusive-IP band should be treated as aspirational, not as a pilot partner’s entry price.

8. What pilots are buying

You are not being asked to underwrite a full company valuation. You are buying a **time-boxed, success-defined pilot** that either (1) proves the evidence pack works in your process and converts to a platform agreement with credit for fees paid, or (2) ends cleanly if success criteria are not met.

- **Downside protected by scope:** one workflow, 60 days, written success tests.
- **Upside aligned:** pilot fee becomes credit toward production if risk/finance accept the pack.
- **No equity required** to run the pilot; commercial terms are service + software access.

9. Suggested next step with you

- 1) 30-minute discovery: decision volume, who owns the audit trail, budget path for a \$50k pilot.
- 2) If qualified: review the pilot Statement of Work and security one-pager.
- 3) Start Date within two weeks of signature; weekly risk/finance check-ins for 60 days.
